

Establishing Safe and Realistic Speed Limits

Lt. Gary Megge
Michigan State Police
Traffic Services Section
michigan.gov/msp-traffic

Our Goal is to Reduce the Number of
Fatal and Serious Injury Crashes

How are Speed Limits Established?

- A speed study is completed (*85th percentile speed determined*)
- Traffic crash data is analyzed (*number/rate and types of crashes*)
- Roadside environment is assessed (*residential, commercial, rural, etc.*)
- Roadway configuration is considered (*number of lanes, length of road, etc.*)
- All other factors that influence traffic and pedestrian movement are included in the **“Engineering and Traffic Investigation”**

How is a Speed Study Completed?

- Conducted during ideal driving conditions (*dry roads with free flow traffic*)
- Vehicle speeds are recorded away from influencing factors (*railroad crossings, signalized intersections, curves in the roadway, etc.*)
- Completed using a LIDAR (laser) in an unmarked vehicle parked in an inconspicuous location, or with automated tube counters

What is “85th Percentile Speed”?

- The speed that 85 percent of the vehicles are traveling at or below
- Ideal speed to set as the maximum limit:
 - Provides the lowest speed variance between vehicles, and thus provides the lowest crash numbers
 - Provides optimum enforceability
- The **SAFEST** speed limit

What is “Variance”?

- A statistical indicator of the overall uniformity of the data set
- In the case of a speed study, variance provides a measure of the uniformity of traffic flow
- Proportional to speed differentials and resulting conflicts between vehicles
- Minimum variance = greatest uniformity and maximum orderly traffic flow

What is “Average Speed”?

- The sum total of the speeds in the sample divided by the number of speed data points in the sample
 - *Not particularly relevant for speed limit setting, but a conventional measure that people are comfortable with*

Crash Involvement vs. Speed

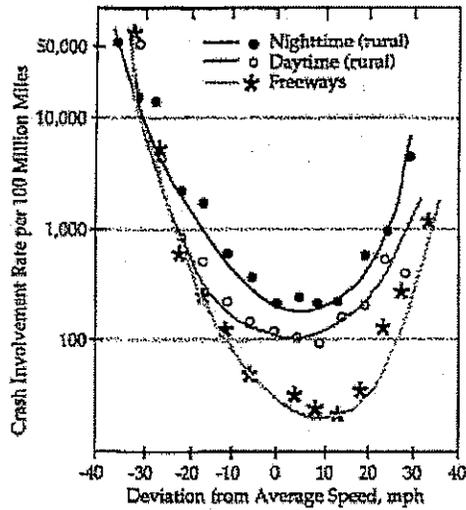

Figure B-2 Crash involvement rate by deviation from average traffic speed (Solomon 1964; Cirillo 1968 in Suister and Coffman 1997, 4). 1 mph = 1.609 km/h.

(OVER CAST/DRY ROAD)

Public Perception

- Perception is that a higher speed limit will make the roadway less safe, because the public falsely thinks the actual travel speeds will increase
- Similarly, perception is that a lower speed limit will make the roadway safer, because the public falsely thinks the actual travel speeds will decrease

Reality

- The **perception** of the roadway becoming less safe is the only thing that changes significantly, Travel speeds don't change
- That perception of reduced safety can actually **enhance** safety by causing users to reduce risk taking behavior
